Report

We have most of the functionalities implemented and working, instructors and students are able to log in and perform duties outlined on the assignment instruction. For example, the student can leave feedback to the instructor, and the instructor can do the same to the students. The student can view their mark on the website and instructor can edit a student's mark also.

We think we need more JavaScript in our project.

There exists a bug, say if an instructor tries to give a student his feedback twice, the program will crash.
Also, when student tries to leave a feedback for instructor for the second time, same error occurs.
The same error persists in student remark, instructor remark.
However, the website will detect blank inputs and tells the user the field must be filled

Yiqian Wu worked on the implementation of HTML, CSS. Also worked on implementing functions in app.py except for register, login and index. Also shares responsibility on debugging and testing. She implemented and finished the JavaScript component of the project.

Yuntian Bo worked on register, login, index in app.py. Also attempted on JavaScript. He worked on testing, adjusting and fine tuning of the project. We encountered a problem where the same project would work on one person's computer but would not work on the other. He was working on getting the project to work properly on both machines.

The work is roughly 50-50 divided between us.
